

3W – Full Stack Internship Assignment

Task 1: Build a Mini Social Post Application

Objective:

Create a simple social post feature where users can create accounts, post text or images, view posts from others, like, and comment — similar to the **Social Page** in the TaskPlanet app.

Step 1 – Explore the Reference App

1. Download and open the **TaskPlanet App** from Play Store:
👉 <https://play.google.com/store/apps/details?id=com.taskplanet>
 2. Go to the **Social Page** from the bottom navigation.
 3. Take UI inspiration from that page and make your project look and feel similar.
-

Step 2 – Features to Build

1. **Account Creation**
 - Simple **signup and login** with email and password.
 - Store user details in the database (MongoDB).
2. **Create Post**
 - A user can post **text, image, or both**.
 - Both fields should not be mandatory (either one is enough).
3. **Feed**
 - All posts from all users should be visible in a public feed.
 - Display username, post content, likes, and comments count.
4. **Like and Comment**

- Other users should be able to like or comment on any post.
 - Show total likes and comments.
 - Save the usernames of people who liked or commented.
-

Step 3 – Tech Stack

- **Frontend:** React.js
 - **Backend:** Node.js + Express
 - **Database:** MongoDB
 - **Styling Options (Choose any one or mix):**
 - **Material UI (MUI)**
 - **React Bootstrap**
 - **Basic CSS**
 *Do not use TailwindCSS.*
 - *(Optional)* You can also make this project as a **mobile app** using **React Native CLI** instead of React.js.
-

Step 4 – Project Guidelines

- Keep your UI **simple, clean, and inspired by the TaskPlanet social feed**.
 - Use **only two MongoDB collections** — one for users and one for posts.
 - Ensure basic authentication flow (signup → login → create post → view feed).
 - Make sure like and comment updates reflect instantly in the UI.
-

Step 5 – Deliverables

You must submit the following:

1. GitHub Repository Link

- Public repository.
- Separate folders for frontend and backend code.

2. Deployment

- Host your project using:
 - **Frontend:** Vercel / Netlify
 - **Backend:** Render
 - **Database:** MongoDB Atlas

Submission Guidelines

 Fill out the Round 1 Task Submission Form

([TASK FORM LINK](#))

Deadline : 10 Sep 2026

Bonus Points For:

- Clean and modern UI
 - Responsive and optimized layout
 - Efficient pagination logic
 - Well-structured and reusable code
 - Code comments and best practices
-
